(1) **[10 pts]** Solve this system of equations:

\[
\begin{align*}
x & -y & -2z & = 2 \\
y & -2z & = 1 \\
-3x & -2y & -8z & = 7
\end{align*}
\]

(2) **[10 pts]** A simple economy consists of two industries, oil and steel. The oil industry consumes \$0.06 worth of oil and \$0.10 worth of steel to produce \$1 of oil. The steel industry consumes \$0.20 of oil and \$0.15 worth of steel to produce \$1 of steel.

(a) What is the Input-Output matrix for this economy?

(b) At what level should each industry produce in order to have \$18 million of oil and \$23 million of steel available for export?
(3) [10 pts] Of 130 students who came to math class, 90 were wearing boots, 62 were wearing a hat, and 50 were wearing both boots and a hat.

(a) Draw a Venn diagram that can be used to represent this situation.

(b) How many students were wearing boots or a hat?

(c) How many students did not wear boots or a hat?

(d) How many students wore boots, but not a hat?

(e) How many students were wearing boots or hats but not both?

(4) [5 pts] How many 4 letter words (including nonsense words) can be made from the letters G, O, P, H, E, R if words must end in a vowel and letters cannot be repeated?
(5) [10 pts] An urn contains 6 red marbles and 4 green marbles. A sample of 7 marbles is selected at random. What is the probability that exactly 4 red marbles are selected?

(6) [10 pts] The table below shows the number of crimes reported by location and by the type of crime.

<table>

<td>102</td>
<td>28</td>
<td>20</td>
</tr>
</tbody>
</table>

(a) What is the probability that a randomly selected crime reported in a residential district is a murder?

(b) What is the probability that a randomly selected crime was committed in a commercial area given that it was an assault?
(7) [10 pts] An automobile tire manufacturer guarantees its tires for 60000 miles. Tests have shown that tires have a life which is normally distributed, with an average life of 70000 miles and a standard deviation of 8000 miles. What percentage of the tires will be returned to the company while under warranty? Support your answer with a graph!

(8) [5 pts] A die is tossed 6 times. What is the probability that a one appears exactly 4 times?
(9) [10 pts] Jesse saves $100 each month in a fund that pays 5.4% compounded monthly. What will be her balance after 25 years?

How much interest will she have earned in that time?

(10) [10 pts] To start up his new business, Henri has borrowed $180,000 at 7% interest compounded monthly, to be paid monthly for 15 years.

What is his monthly payment?

What is the balance on the loan at the end of 10 years?
(11) [10 pts] You make a deposit of $15000 in an account earning 6% compounded monthly. Each month you withdraw $150.

Write a difference equation showing the balance, \( y_n \), at the end of each month.

What is the balance at the end of 10 months?

What is the \textit{minimum} initial deposit you would need to make so that you could withdraw $150 per month forever?
Summary of Finance Formulas

Compound Interest

\[ F = P \cdot (1 + i)^n \]

\[ P = F \cdot (1 + i)^{-n} \]

Annuities and Sinking Funds: Future Value

\[ F = R \cdot \left[ \frac{(1 + i)^n - 1}{i} \right] \]

\[ R = F \cdot \frac{i}{(1 + i)^n - 1} \]

Annuities: Present Value

\[ P = R \cdot \left[ \frac{1 - (1 + i)^{-n}}{i} \right] \]

\[ R = P \cdot \left[ \frac{i}{1 - (1 + i)^{-n}} \right] \]
